

**AC thermostat has been set to a low temperature of
70F with the fan set to AUTO
You can adjust it above 70F, but not below**

Please know this is not me being unreasonable; air conditioners have frozen because the temperatures were **a)** set to low and **b)** had the fan on ON. This overworked the units and caused them to freeze. When that happens, the units must be turned off to thaw out completely, which takes at least 1 day. Then the AC technician must come out to ensure it can be turned back on; this is day 2. So, in the middle of summer, the AC would be down for a minimum of 2 days. I am hopeful that with a minimum temperature of 70F and the fan on **AUTO**, this will minimize, if not eliminate, the ACs from freezing and being out of commission for 2+ days.
